

## **Bitdefender Security Suite for MSPs offer patch management, cloud sandbox, detection and response**

**July 2018**, Bitdefender, a leading global cybersecurity technology company protecting over 500 million users worldwide, today announces three new products to let Managed Service Providers tap the rapid growth in demand for advanced threat prevention, detection, investigation and response services.

Bitdefender Cloud Security for MSP, now includes Patch Management, Advanced Threat Security (with HyperDetect and Sandbox Analyzer), and Endpoint Detection and Response. The new offerings are optional and will be available with monthly usage-based licensing for MSPs from the same multi-tenant Bitdefender cloud console that MSPs use today. From this single pane of glass, MSPs can deploy and manage the new products along with antivirus/antimalware protection, content control, device control, MS-Exchange security, full disk encryption, virtualization and cloud security.

“Organizations demand comprehensive next-gen layered security that can help them combat increasingly sophisticated ransomware, Zero-day, fileless and hacking attacks. Bitdefender MSP Security Suite is designed to meet this demand,” said Jose Lopez, Vice President of Global Sales, Service Providers and Technology Licensing, Bitdefender. “With the new tunable machine learning, detection, investigation, and response capabilities, MSPs and MSSPs can now add specialized security services to address the needs of companies that are highly sensitive about their data and concerned about advanced or targeted attacks.”

Instead of stacking up solutions with different management consoles and agents, Bitdefender Cloud Security for MSP provides a complete endpoint security suite with unified management and a single agent, streamlining security and eliminating slowdowns for customers. The new services, include:

Patch Management, which reduces patching efforts and costs, offering a single source of patching with the largest database of Windows and third-party applications. Patches can be applied automatically to all devices anywhere, both on-site and at remote locations, reducing the window of opportunity for attackers to exploit vulnerable applications.

Advanced Threat Security, includes HyperDetect which is designed to block attacks at pre-execution with tunable machine learning capabilities and Sandbox Analyzer for enhanced targeted attack detection. It protects against fileless attacks, PowerShell and other script attacks, and delivers improved threat context and visibility.

Endpoint Detection and Response, correlates information from different sensors, looks for anomalous behavior and offers clear visibility into indicators of compromise (IOCs) and one-click threat investigation and incident response workflows. This enables service providers to meet customer demands and grow with managed detection and response services.
