DNSFilter®

DNSFILTER® IS A CLOUD-HOSTED CONTENT AND THREAT FILTER WHICH PAIRS A RELIABLE ANYCAST NETWORK WITH A WORLD-CLASS ARTIFICIAL INTELLIGENCE SCANNING ENGINE. ALL WITH TRANSPARENT, NO COMMITMENT PRICING.

DNSFilter offers comprehensive content filtering and threat protection for all of your networks. No more hardware maintenance or software patching! Our cloud topology is spread across multiple providers, ensuring a solid platform to control what your users are allowed to access online. Our purpose-built AI scanner can classify content in realtime as well as detect threats encountered on the internet, such as phishing and malware domains.

Over the lifetime of DNSFilter, our network has achieved 100% uptime. We've engineered our DNS system to be able to recover from multiple sources of degradation, so you can always depend on us to filter your networks.

All features can be administered remotely from any device using our online dashboard. If you are a service provider, you can even grant permissions to your clients to make policy adjustments, reducing your management responsibility.

High Performance Platform

Global Network

Our servers are spread across 35 cities around the globe. No matter where your offices are, your employees will always reach the nearest server to their location. This is true even if they are roaming internationally. When your employees step off the plane, they'll get the same performance as back home.

A.I. Driven

Our platform is driven by a machine learning engine. This means that when your users visit unknown sites, they are categorized and checked for security threats in real-time. We also augment the scanner with feeds from top antivirus, anti-terrorism, and child abuse vendors. You'll always be protected.

All Platforms

Many threats to your network come from outside the network. DNSFilter is the only filtering company to offer access to our platform via a comprehensive offering of Windows, MacOS, Android, iOS, Chromebook, Docker, and Virtual Machine. This means you can filter all devices, whether they are on or off-network.

Comprehensive

DNSFilter takes only a few minutes to configure on your network equipment. After initial configuration, all adjustments are made through our online dashboard. You have complete control of all policies, devices, and users in your account.

Detailed reporting gives you the ability to see billing and account statistics, such as your busiest locations and top requested domains. This helps you to visualize network activity, and make adjustments to what your users are allowed to access.

Real Time A.I. Categorization

The internet is a BIG place. More than 126,000 domains are registered each day, making it impossible for human-controlled block lists to catch up with classifying websites and identifying potential malware or phishing attempts. This creates a major vulnerability in most filtering/security solutions.

DNSFilter has an artificial intelligence engine, which classifies domains in real time. When your users visit a domain, our scanner fetches it and classifies it immediately. The classification is then matched against your policy to determine if the user can access it.

Our scanner also utilizes image-based analysis, which is able to defeat phishing attempts, such as those which mimic Google, Microsoft, and Dropbox logins.
