HERE'S WHY YOU SHOULD CUT THE CORD

By moving your business phone system to the cloud, you will get:

Cost savings

First things first – stop paying the phone company. With a hosted system, your phone calls are delivered through your existing internet connection. There's no major phone equipment to purchase, except maybe new desk phones. And you'll have fewer expenses in the form of repairs and downtime since everything is located in the cloud.

Scalability

It's easy to add and remove extensions as your business needs change. You can even connect with mobile devices for those that don't need to be in the office. So you're only paying per-user per-month.

Outsourced maintenance

All of the upkeep and maintenance is managed by the provider off-site. Which means you can free up any in-house staff from maintaining your phone system – saving you time and money. And the best part, the hosted phone system doesn't need to be taken offline for maintenance, updates or repair during business hours.

Reliability

With POTS, if a line is down the call can't go through. With an internet-based phone system, multiple routes can be established for digital data to travel, keeping your phones up and running.

Disaster recovery

Your phone system's infrastructure is protected in a hosted environment, so no matter what happens at the office, communication flow can continue even in an emergency. And if your internet or network goes down, calls can still be placed and answered through the mobile client, which works just like a desk phone.

Extra features and increased productivity

With the mobile app you hold the power of your desk phone in your hand, giving you the freedom to work wherever. You can answer, hold, conference, transfer and more. Other cool features of switching to a hosted system can include caller dashboards, call reporting, advanced caller ID, automatic upgrades, and voicemail/faxes being sent directly to your email.
